Password: Change Your VPS Root Password Instantly

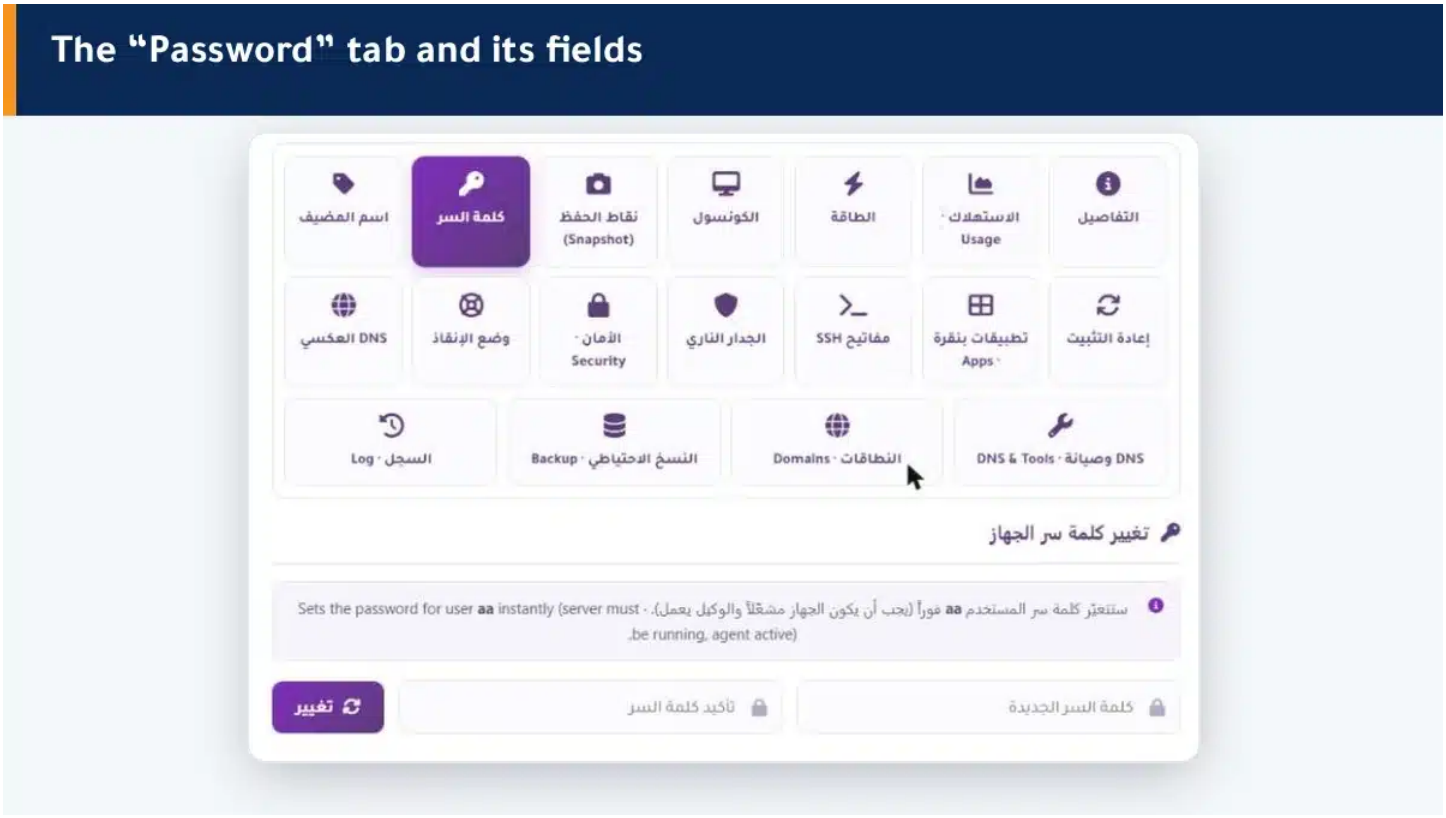

Hyyat VPS Control Panel · https://www.hyyat.com/en/knowledgebase/change-vps-root-password/

In short The “Password” tab changes your machine login password instantly from the browser, with no commands. The machine just needs to be running for the change to apply. Use it if you forgot the password, suspect it leaked, or want to strengthen it. Choose a long password mixing letters, numbers and symbols to stay safe.

Embedded media: https://www.hyyat.com/wp-content/uploads/2026/11/vpspanel-pw-en.mp4?_=1

The login password is the key to your server. If you forgot it, suspect someone learned it, or simply want to strengthen it, the **Password** tab changes it instantly from the browser without typing a single command.

The “Password” tab and its fields

How do I change the password?

- Open the **Password** tab in the control panel.
- Type the **new password**, then retype it in the confirm field.
- Click **Change** — it applies instantly to the login account on your machine.

The machine must be **running** for the change to apply instantly. If it is stopped, start it first from the Power tab.

Strong password tips

- Make it long: 16 characters or more is far stronger than a short complex one.
- Mix upper and lower case letters, numbers and symbols.
- Do not use your name, your domain, or common words that are easy to guess.
- Do not reuse a password you use somewhere else.

When to use this tab

Situation	What to do
You forgot the login password	Set a new one here right away
You suspect the password leaked	Change it at once, then check Security
You handed the machine to someone and they finished	Change the password to cut their access
Your current password is weak	Replace it with a long, strong one

And for the safest login with no password at all, use SSH keys.

Summary

- The Password tab changes your machine login password instantly from the browser.
- The machine must be running for the change to apply.
- Choose a long password mixing letters, numbers and symbols.

For higher security, add SSH keys to log in without a password.

Frequently asked questions

Does the password change apply instantly?

Yes, it applies directly to the login account on your machine, as long as the machine is running. If it is stopped, start it first from the Power tab.

I completely forgot the server password, can I recover it?

The old password is not recovered, but you set a new one from this tab instantly and log in with it. You do not need to know the old one.

Which account does it change the password for?

The main login account of your machine (root or the admin account). Use it to log in over SSH or the console.

What makes a strong password?

A long password (16+ characters) mixing upper and lower case letters, numbers and symbols, with no name or common words, not reused anywhere else.

Is a password or SSH keys better?

SSH keys are more secure because they allow login without a password that is hard to protect. You can use both together; see the SSH keys tab.
