After installing **CloudPanel** on a VPS, the next step is creating your first website. CloudPanel supports several site types (PHP, WordPress, Node.js, Python, Static) from a modern, fast interface. In this guide from the Hyyat Host team we show how to add a site, point your domain and choose the PHP version.

You first need a VPS with the panel installed. If you haven't started, Hyyat Host virtual servers are ready with fast NVMe storage, full root control and Arabic support.

This guide follows on from the step-by-step CloudPanel install guide; if you haven't installed the panel yet, start there.

Before you start

- CloudPanel installed and running, and you are logged in on port 8443.
- A domain pointed to your server's IP via an A record in DNS.

- A decision on the site type (WordPress, a general PHP site, or a Static site).

Steps to create the website

1. **Open the add-site page** From the main interface click the `Add Site` button.
2. **Choose the site type** Choose `Create a PHP Site` for a general PHP site (or another type as needed).
3. **Enter the domain and user** Type the domain in `Domain Name`, the site username and `Site User Password`.
4. **Pick the PHP version** From `PHP Version` choose a recent version (8.1 or newer).
5. **Create the site** Click `Create` and the site is created within seconds.

After creation the site appears in the main list, and from its page you manage files, databases, the SSL certificate and the PHP version.

What next after creating the site?

- Upload your site files via the `File Manager` or SFTP with the site user.
- Or create a ready WordPress site — see installing WordPress on CloudPanel.
- Secure your site with a free SSL certificate — see issuing SSL on CloudPanel.

Common issues and fixes

- **Site won't open after creation:** make sure the domain points to your server IP in DNS; propagation may take some time.
- **Error on creation:** make sure the domain isn't already added and is written without http.
- **You want a Node.js or Python site:** choose the matching type from `Add Site` the same way.

Next step

- Install WordPress or upload your site files.
- Issue a free SSL certificate to secure the site.
- See the VPS control panel comparison if you're weighing your options.

And if you'd like us to handle the setup for you, open a support ticket — we reply within 24 hours at most.

Frequently asked questions

Where do I create the site in CloudPanel?

From the Add Site button, by choosing the site type and entering the domain, user and PHP version then Create.

Which site types are supported?

PHP, WordPress, Node.js, Python, Static and Reverse Proxy, all from the Add Site interface.

Can I change the PHP version later?

Yes, from the site page you can switch the PHP version at any time.
