After installing **CyberPanel** on a VPS, the next step is creating your first website. In this guide from the Hyyat Host team we show how to add a new site, point your domain and pick the right PHP version, in a few simple steps from the graphical interface.

You first need a VPS with the panel installed. If you haven't started, Hyyat Host virtual servers are ready with fast NVMe storage, full root control and Arabic support.

This guide follows on from the step-by-step CyberPanel install guide; if you haven't installed the panel yet, start there.

Before you start

- CyberPanel installed and running, and you are logged in as admin.
- A domain pointed to your server's IP via an A record in DNS.
- A decision on the PHP version for your site (WordPress runs well on PHP 8.1 or newer).

Steps to create the website

1. **Open the create-website page** From the side menu choose `Websites` then `Create Website`.
2. **Choose the package and owner** Leave `Package` as Default and `Owner` as admin if you are the administrator.
3. **Enter the domain and email** Type the domain in `Domain Name` and an address in `Email`.
4. **Pick the PHP version** From `Select PHP` choose a recent version (8.1 or newer for WordPress).
5. **Create the site** Enable the SSL and DKIM options if you wish, then click `Create Website`.

Within seconds the site appears under `Websites → List Websites`, and the `Manage` button lets you handle all its details later.

What next after creating the site?

- Upload your site files via the file manager or an FTP account.
- Or install WordPress in one click — see installing WordPress on CyberPanel.
- Secure your site with a free SSL certificate — see issuing SSL on CyberPanel.

Common issues and fixes

- **Site won't open after creation:** make sure the domain points to your server IP in DNS; propagation may take some time.
- **Error on creation:** make sure the domain isn't already added and is written without http.
- **You want a subdomain:** use `Create Website` the same way with the full subdomain name.

Next step

- Install WordPress or upload your site files.
- Issue a free SSL certificate to secure the site.
- See the VPS control panel comparison if you're weighing your options.

And if you'd like us to handle the setup for you, open a support ticket — we reply within 24 hours at most.

Frequently asked questions

Where do I create the site in CyberPanel?

From the Websites menu then Create Website, by entering the domain, email and PHP version.

How many sites can I create?

Practically unlimited within your server resources; CyberPanel is free with no limit on sites.

Can I change the PHP version later?

Yes, from the site management you can switch the PHP version at any time.
