Domains: Point Your Domain to Your VPS (A Record)

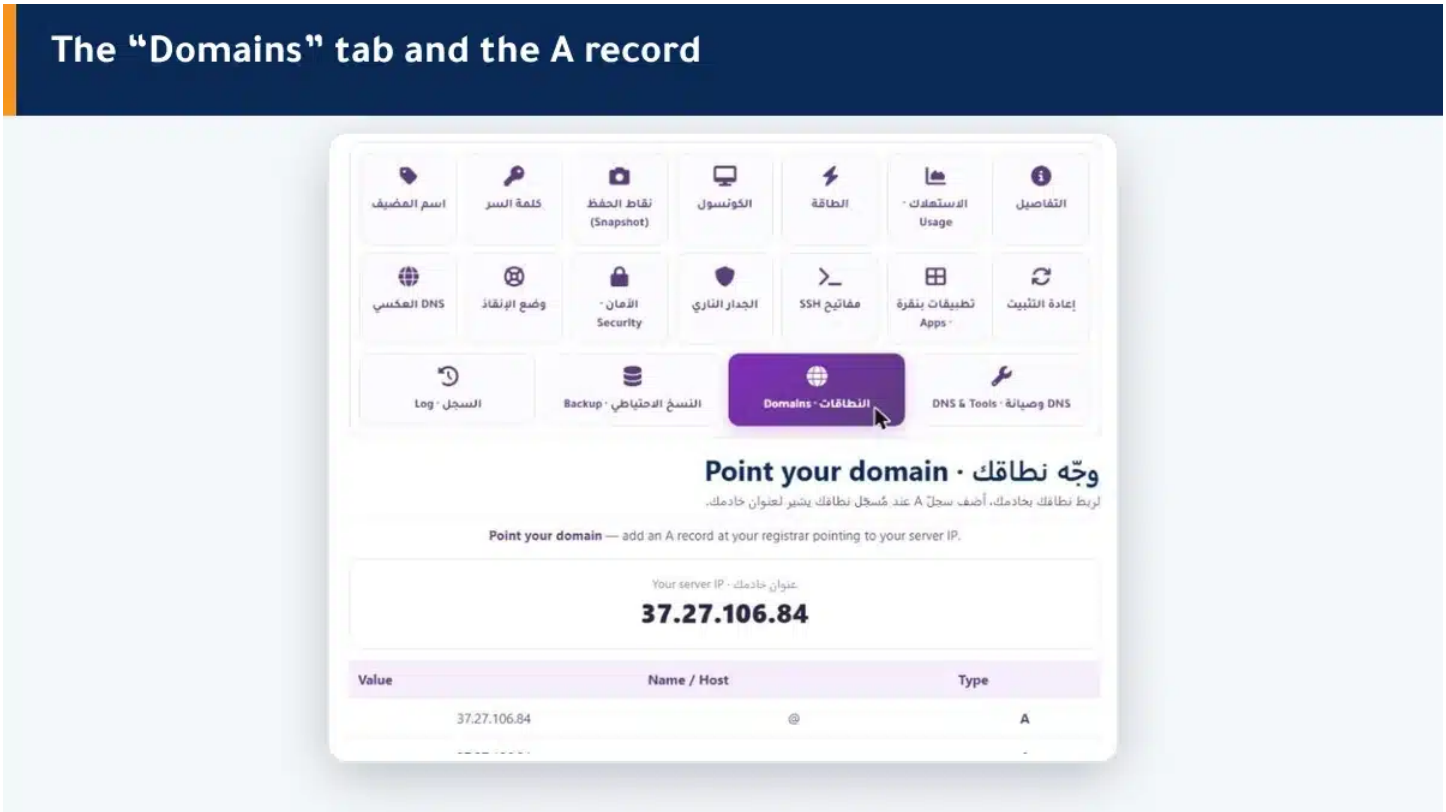

Hyyat VPS Control Panel · https://www.hyyat.com/en/knowledgebase/point-your-domain-to-vps-a-record/

In short To run your site on your domain name instead of the machine address, add an A record at your domain registrar pointing to your server address. The “Domains” tab shows your machine address and the records needed (@ and www). After adding, the change may need some time to propagate across the internet.

Embedded media: https://www.hyyat.com/wp-content/uploads/2026/11/vpspanel-dns-en.mp4?_=1

After setting up your server, you want your site to work on your domain name like example.com instead of the machine address. The way is simple: you tell your domain to point to your machine through an **A record**. The **Domains** tab gives you everything you need.

The “Domains” tab and the A record

How do I point my domain?

- Open the **Domains** tab — your **server address (IP)** appears.
- Go to your **domain registrar** panel (where you bought the domain).
- Add an **A** record for the name **@** pointing to your server address.
- Add another **A** record for the name **www** pointing to the same address.

After saving at your registrar, your domain starts pointing to your machine. Propagation may take minutes to hours.

Pointing the domain happens at your **registrar**, not from this tab; the tab only shows you the address and the needed records to copy.

Summary

- Add an A record at your registrar pointing to your server address.
- Add it for both names @ and www.
- Wait for the change to propagate (minutes to hours).

After connecting the domain, set up your site quickly with one-click apps.

Frequently asked questions

How do I connect my domain to my server?
Add an A record at your domain registrar pointing to your server address (IP) shown in the Domains tab, for both names @ and www.

Where do I add the A record?
At your domain registrar (where you bought the domain), in its DNS settings, not from the VPS panel.

How long until the site appears on my domain?
Usually minutes to a few hours for the change to propagate across internet servers.

What is the difference between @ and www?
@ represents your root domain (example.com), and www represents www.example.com. Add an A record for both so the site works either way.

Does Hyyat Host host my domain DNS?

This tab points you to add an A record at your registrar directly, which is the simplest and most efficient way for most cases.
