DNS & Tools: Change DNS Resolvers and Clear VPS Logs

Hyyat VPS Control Panel · https://www.hyyat.com/en/knowledgebase/vps-dns-resolvers-and-clear-logs/

In short The “DNS & Tools” tab brings two tools: changing the DNS resolvers your machine uses to turn domain names into addresses, and clearing old logs to free disk space. Use the first if name resolution is slow, and the second if the disk fills up with logs.

The **DNS & Tools** tab is two simple maintenance tools for your machine: setting the DNS servers it asks when turning domain names into addresses, and cleaning old logs that use the disk.

Change DNS resolvers

DNS resolvers are what turn names (like example.com) into addresses for your machine. You can set two servers:

- Type **DNS 1** (primary), such as 1.1.1.1.
- Type **DNS 2** (optional) as a backup.
- Click save — your machine starts using them.

Change them if you notice slow name resolution or want a specific server.

Clear old logs

Over time, system logs pile up and use disk space. The **Clear logs** button cleans the old ones to free space, without touching your files or sites.

Watch your disk space from Usage; if disk activity rises or it fills up, clearing logs is a useful first step.

Summary

- Change DNS resolvers if name resolution is slow.
- Clear old logs to free disk space.
- Both are safe and do not touch your files or sites.

Watch the maintenance effect on disk from the Usage tab.

Frequently asked questions

What are DNS resolvers?
They are the servers your machine asks to turn domain names into addresses. Changing them may speed up name resolution or let you use a server you prefer.

Does changing DNS resolvers affect my site?
It does not affect how your site works for visitors; it concerns how your machine resolves names when it connects out.

Does clearing logs delete my data?
No. It only clears old system logs to free disk space, and does not touch your files, sites or databases.

When should I clear logs?
When the disk fills up or log space rises. Watch that from the Usage tab.

What is the best DNS server to use?

Reliable public servers like 1.1.1.1 or 8.8.8.8 are a good choice. You can keep the primary and add a second as backup.
