Usage: Track CPU, Memory, Network and Disk on Your VPS

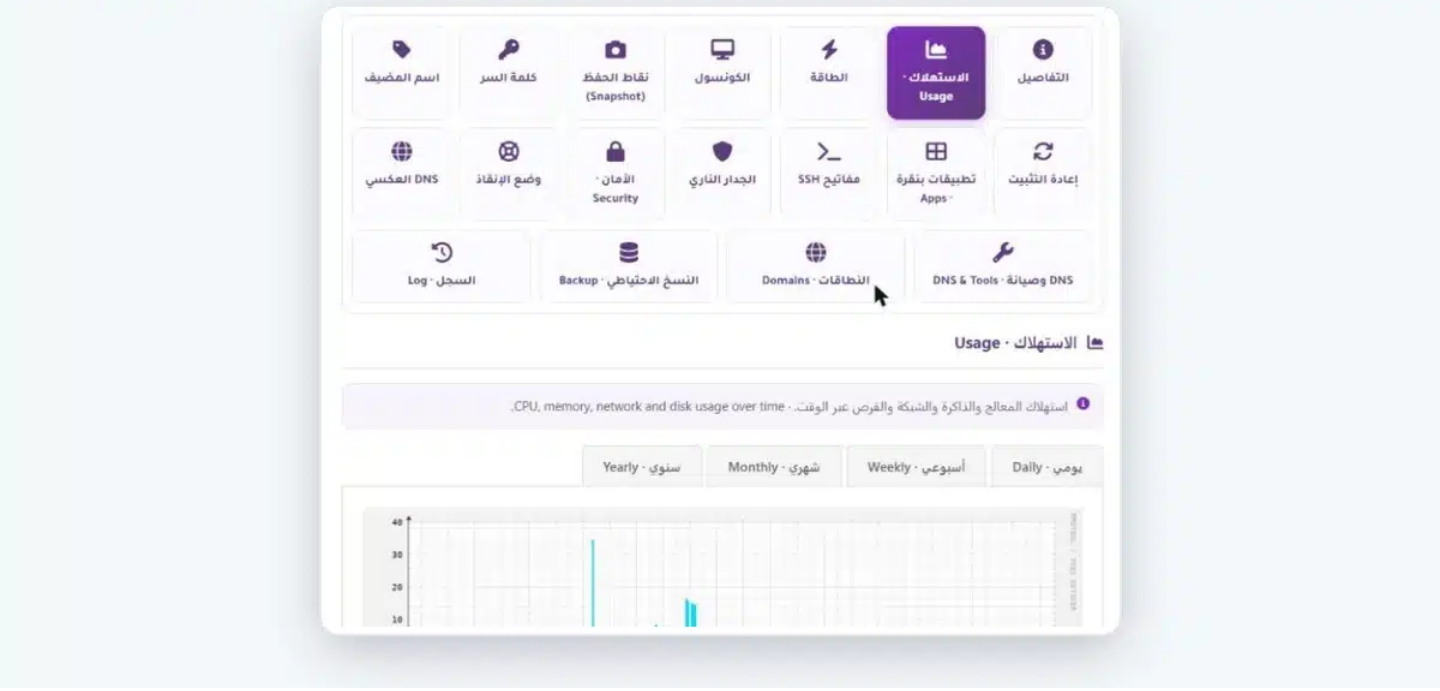

Hyyat VPS Control Panel · https://www.hyyat.com/en/knowledgebase/vps-usage-cpu-ram-network-disk/

In short The “Usage” tab shows graphs of CPU, memory, network and disk usage over time. You pick the period (daily, weekly, monthly, yearly) to see whether your machine is comfortable or near its limit. Constantly sitting near 100% means the plan has become small for your site, or a process is using more than it should.

How do you know your server is enough for your site, or that it has started to choke? The **Usage** tab answers with numbers: graphs that show how much your machine uses of CPU, memory, network and disk over time, so you decide on clear data instead of guessing.

The “Usage” tab and its graphs

What do the graphs show?

Resource	What a high value means
CPU	Many processes or heavy code; the site may slow down
Memory (RAM)	Near the limit means you need more memory or to tune your apps
Network	The size of your traffic, upload and download
Disk	Read and write activity; constantly high slows everything down

Choosing the period

Above the graphs are the period buttons: **Daily · Weekly · Monthly · Yearly**. Start with “Daily” to see the state now, then “Weekly” or “Monthly” to spot a repeating pattern — such as usage rising every evening with the traffic peak.

What do I do if usage is high?

- If the rise is momentary at a peak, that is normal; just watch it.
- If CPU or memory stays near 100% constantly, the plan has become small for your site.
- Check security from the Security tab, as an unwanted process sometimes raises usage.
- Try a reboot if a sudden, unexplained rise appears.

Upgrading the machine resources (resize) affects billing and is arranged with us — open a ticket and we will help you pick the right plan. We reply within 24 hours at most.

Summary

- Usage shows CPU, memory, network and disk over time.
- Switch between daily/weekly/monthly/yearly to spot the pattern.
- Constantly near 100% is a sign you need a bigger plan.

If you suspect a process is raising usage, start from the Security tab.

Frequently asked questions

How often does the usage graph update?

The graphs refresh periodically and show the data across the chosen period. Pick “Daily” for the most recent, near-live picture, and longer periods to see the pattern.

Usage is high, is my server broken?

Not necessarily. A rise during a traffic peak is normal. The concern is CPU or memory staying near 100% constantly, which usually means the plan is small or a process is using more than it should.

How do I know I need a bigger plan?

If CPU or memory sits near the maximum most of the time, not only at peaks, it is time to upgrade. Open a ticket and we will help you choose.

Does high network usage mean a problem?

Not always; it reflects your traffic and transfers. Watch it alongside the other resources, and if it is completely unexpected, check security.

Can I upgrade the resources myself from here?

Resource upgrades affect billing and are arranged with us for now. Open a support ticket and we will set it up for you.
